

Report October 2015

This is a progress report for the NVDA project in the month of October 2015. The development work is going on in the text to speech engine TTS eSpeak and the screen reader NVDA.

NVDA section

The following issues were worked on in the month of September:

Bug ID	Description	Status
User study	A user study was conducted. Some use cases were designed and given to the target population for NVDA. The use cases were about the bug fixes and new features introduced in NVDA. A small survey was carried out to find out the utility and usability of the bug fixes and the features introduced in NVDA.	It took a considerable amount of time in making the questionnaires and then getting the feedback from the target population. The task is completed
2471	Visual Studio 2010 Open Code Editor File Name Not Reported#2471 Changing between open code editor files with Ctrl + F6 (for example), NVDA doesn't speak the currently active file's name or title of the editor window. NVDA does speak the line the cursor is on.	The work is in progress.
4909	Reference bug#1541: MS Word- charts are not detected and read by NVDA. View all NVDA does not Inform about the presence of the charts in MS Word documents. There is no way one can reach the charts and read and analyze the charts in Word documents. Charts are very important for analyzing the business reports. Persons who have to study economics also have to read and understand charts a lot. But as NVDA just cannot read the presence of charts and has no way available to analyze the charts such jobs are not possible with NVDA.	The work is in progress.
